Urgent

Teaching an AI to listen.

Cookiy AI turns a hundred raw interviews into trustworthy research intelligence by tomorrow. This is the story of designing it from zero to product, with a seed stage team, in twelve months.

Cookiy AI | Real Conversations
Authentic Insights

What Cookiy is.

Cookiy AI is reimagining how user research works in the age of AI — transforming conversations into signals, insights, and decisions at scale.

How **It** works

Research At The Speed Of Thought
—Without Losing Human Depth.

01 Discussion Guide

02 Smart Recruit

03

AI-led Interviews

Input your research goals, and our AI generates a comprehensive discussion guide tailored to your objectives.

04 Actionable Insight

What I did.

Turning an ambitious vision for AI-native research into a scalable product, system, and customer experience.

At early-stage startups, I turn UI concepts into working demos—helping product and engineering validate ideas earlier and ship faster. This is one of them.

TRY DEMO

Product Design 0-1

Designed the end-to-end experience of the AI research platform, including user flows, information architecture, dashboard experiences, and research workflows.

Demo Code: 573573

AGENT SKILL

Report Skill Design

Worked on prompt frameworks, workflow logic, and human-AI collaboration models for features like Signal Intelligence, Adaptive Follow-ups, and Emotion Analysis.

The Report made by this skill

Concept to enterprise

Design Reflection

During building Cookiy, design decisions were never just visual. Each of these three challenges could fill an hour on its own.

Does Every AI Startup Eventually Lose Its App?

As intelligence becomes the product itself, interfaces begin to matter less.

When **users (AI-native)** can simply describe outcomes, what role should software still play?

Confidentiality vs. Visibility?

Enterprise customers demand confidentiality. Startups depend on visibility.

Designing between **trust and exposure** became one of the hardest parts of building a B2B product.

Enterprise Product, Consumer Dynamics?

Skill created a direct relationship between an enterprise platform and individual users.

It challenged many assumptions I had about growth, adoption, and monetization.

I'd love to talk through them
with you in person.

UV Mapper

UVMapper is a navigation app that helps users avoid UV exposure by calculating real-time solar intensity and mapping shaded routes using building and tree coverage. Designed for commuters and people with photosensitivity, it also offers AR guidance for healthier urban exploration.

red**dot** winner 2025

About Project

Overview

With The Rise Of Urban Temperatures And UV Levels Due To Global Warming, Walking Under Direct Sunlight Has Become A Growing Concern — Especially For Commuters And People With Sensitive Skin.

Brief

Help People Avoid Excessive UV Exposure During Everyday Walks, While Making Their Journey More Comfortable And Engaging?

Why this matters

As cities heat up and UV levels climb, walking in direct sunlight is becoming a health concern. But navigation tools still ignore sunlight as a constraint.

UV Index Rising

Several studies have shown that surface UV radiation levels are on the rise worldwide, especially in mid- and low-latitude regions.

Sunlight Discomfort

60% of users reported avoiding sunny streets due to skin discomfort or heat stress.

Users Already Adapt

28% of pedestrians actively choose shaded paths when possible — without any tool to support it.

Research & Insight

We interviewed **12** pedestrians across 3 cities (Shanghai, London, Guangzhou).
Most reported avoiding certain roads due to strong sunlight exposure.

66%

Prefer shaded routes even if it takes longer

41%

Want smarter walking tools that consider comfort

"My skin burns after 10 minutes, so I plan routes ahead of time."
— Sensitive Skin User, London

"I always cross the street just to walk in the shadow of a wall."
— Urban Commuter, Guangzhou

"I don't use GPS anymore — I use tree shadows."
— Protective Parent, Shanghai

What users told us

Through street interviews and remote surveys, we learned that sunlight is not just a physical discomfort — it's a navigational constraint. People already plan routes to avoid heat. Our role is to design for that existing behavior with better tools.

Insight

People are already self-navigating based on sunlight, but current apps don't support this behavior.

Opportunity

Build a navigation system that uses **shade as a first-class routing factor**, turning sunlight from invisible friction into visible guidance.

Design & Process

Storyboard

UV levels exploding today!!!

Using the app UV mapper.

Finding a path that's always been in the shadows

Enjoy the shadow journey.

Sketch & Low fidelity

The logic of the APP still refers to the interaction logic of ordinary navigation, but it will have an additional AR function, and the guided routes will include shopping malls, skywalks, subway stations, etc.

UI Design

How it work <https://youtu.be/uNRYFaKjyuM>

Smart Shade-based Navigation

**Find the shadiest route
to your destination, with
paths that adapt to
sunlight, buildings, and
trees in real time.**

**Use it like a
normal
navigation**

Smart Shade-based Navigation

Live UV maps

Smart Shade-based Navigation

Find the shadiest route
to your destination,
with paths that adapt
to sunlight, buildings,
and trees in real time.

Live UV Map

See the city in a new light. Real-time UV levels are mapped onto your surroundings, helping you to avoid harmful exposure.

AR Guidance

AR Guidance navigates spatial cues in your environment, making every step in intuitive and informed.

Live UV Map

Get real-time UV index updates wherever you are.

UV Mapper monitors local conditions and highlights hotspots, helping you plan your walk when the sun is strongest — or avoid it altogether.

Shade-Based Navigation

Not just the shortest path — the smartest one.

Our algorithm finds walking routes based on building shadows, tree coverage, and underground access, keeping you in the shade from point A to B.

AR Guidance

See your shade route come to life.

With AR navigation, UV Mapper overlays live directions and shaded areas directly on your surroundings, helping you stay on track — and out of the sun.

Commi lets meme coin devs turn meme sharing into real rewards — making it visible, trackable, and part of the hype.

Keywords: Web3, Meme Token, Distribution System, Info Architecture, Pitch Deck, UX Design

The platform was launched on Twitter (X) and is expected to go live around August.

About Project

📁 How It Work :

Commi Helps Meme Coin Projects Reward People For Sharing Memes — So Spreading Becomes Part Of The Coin's Growth.

🚀 Brief

More Than A Meme Tool. It Rewards Real People, Encourages Active Sharing, And Keeps Bots Out.

💡 Product Highlights

- **Automatic Token Drops**
Get Tokens Automatically By Interacting, Staying Active, And Completing Tasks — No Need To Claim Manually.
- **Anti-Cheater System**
We Use Meme Community Reputation To Make Sure Rewards Go To Real Users, Not Bots.
- **Staking Buffs**
The Longer You Stake, The Stronger Your Buff — More Rewards And More Influence.

My Role

Responsible for branding, Pitch Deck design, and parts of UX/UI production.

1. Designed the logo, brand colors, visual identity system, and promotional materials — defining the “neon green + black background” style.
2. Planned the structure of the pitch deck and created all visual charts, including market maps, radar charts, and competitor analysis.
3. Collaborated with the PM on feature logic (e.g. Launchpad, rewards system, and incentives), and contributed to the UI design.

Logo Design

Why the Green Drink & the Name “Commi”?

“Commi” comes from “come in” — it’s an open invite to join the meme world. The green drink logo feels like a mix of poison and energy shot — bold, tempting, and a little dangerous, just like meme coins.

Main

Secondary

Why Green

We picked green because in Western markets, it signals growth and good luck — perfect for a project about going viral and rising fast.

Nunito Sans

Nunito

Commi

From .co to .fun

This is a meme distribution platform centered around community contribution — from the distribution layer for memecoins to the infrastructure for smarter launch.

Users don't just consume content—they actively create, curate, and share it. Every meme that gets shared can trigger token distribution, turning social engagement into real rewards.
